## User Guide

**Transaction Lifecycle Monitoring & Investigation**

*A practical guide to monitoring transactions, reviewing investigation findings, and managing your account.*

# 01 — About Txnora

Txnora is a transaction lifecycle monitoring and investigation platform that helps teams understand the progress of transactions and review issues that may require attention.

It brings transaction records, status history, and available investigation findings together in one place. This helps users review what has happened to a transaction, understand its current status, and examine recorded information when something goes wrong.

Txnora is designed for support and operations teams that need a clear view of transaction activity without having to interpret technical system details.

## Who can use Txnora?

Txnora provides two account roles:

- **Administrator (ADMIN):** Has access to the application's administrative areas, including user and invitation management.
- **Support (SUPPORT):** Uses the application to review transaction activity and investigate transaction-related issues.

The sections available to a user depend on their assigned role.

# 02 — Navigating the Dashboard

The Dashboard provides an overview of transaction activity recorded in Txnora. It helps users understand the current state of transactions without reviewing every record individually.

The dashboard includes transaction summaries and a recent-transactions view.

## Understanding the summaries

Transaction counts and status summaries help users see how transactions are distributed across different stages.

The settled-money figure represents transactions recorded as **SETTLED**, rather than the combined value of transactions still in progress or marked as failed.

## Recent transactions

The recent-transactions section provides a quick view of the latest transaction records. Users can open the Transactions section to review transaction records in greater detail.

**Helpful tip:** Use the Dashboard for an overview and the Transactions section when you need to examine a particular record.

# 03 — Reviewing Transactions

The Transactions section provides a view of transaction records stored in Txnora.

Each record contains information that helps users identify and understand a transaction, including its identifier, amount, currency, merchant, current status, and available timestamps.

## How to review a transaction

1. Open the Transactions section.
2. Locate the transaction you want to review.
3. Check its current status and displayed details.
4. If the transaction has failed or appears delayed, review its investigation information where available.

A transaction's current status describes its recorded stage. To understand how it reached that stage, the available transaction history and investigation findings may provide additional context.

## Why transaction status matters

Transactions move through different stages as processing progresses. A transaction that has been authorized is not necessarily settled, and a transaction that is still processing should not automatically be considered failed.

Always distinguish between a transaction's current status and its final recorded outcome.

## 04 — Understanding Transaction Statuses

Txnora uses the following transaction statuses.

**INITIATED — Transaction Started**

The transaction has been created and recorded in the system. It has not yet progressed to a later recorded stage.

**PROCESSING — In Progress**

The transaction is being processed. If it remains in this state longer than expected, review the transaction's available details and investigation information.

**AUTHORIZED — Authorization Received**

The transaction has reached the authorization stage. Authorization does not, by itself, mean that settlement has been completed.

**SETTLEMENT_PENDING — Awaiting Settlement**

The transaction is waiting for settlement to complete. If the status remains unchanged longer than expected, the transaction may need further review.

**SETTLED — Settlement Completed**

The transaction has reached the settled stage recorded by Txnora.

**FAILED — Marked as Failed**

The transaction has been marked as failed. Review the available investigation findings to understand the recorded reason, if one is available.

## Important distinction

A transaction remaining in PROCESSING or SETTLEMENT_PENDING is not automatically a failed transaction. Its status, recorded history, elapsed time, and available evidence should be considered before drawing a conclusion.

# 05 — Investigating Transaction Issues

The Investigations section helps users examine a transaction's recorded history and available risk-evaluation findings.

It is particularly useful when a transaction is marked as failed or appears to be taking longer than expected.

## What can an investigation show?

Depending on the information available for the transaction, the investigation view can include:

- The transaction's recorded details and current status.
- Its available status history.
- Risk-evaluation results associated with the transaction.
- A recorded failure reason and related rule, when the transaction is marked as failed and a rejected risk-evaluation result provides that information.

## How to investigate a transaction

1. Identify the transaction that requires attention.
2. Open its investigation details using the available application controls.
3. Review its status history and available risk-evaluation results.
4. Read the displayed failure explanation, if one is available.
5. If the available information does not establish the cause, follow your team's process for further review.

## Interpreting investigation findings

Investigation results depend on the information recorded for a transaction. A displayed failure reason can help explain a recorded rejection, but it should not be treated as proof of a cause that the available evidence does not establish.

If a transaction remains in progress, review the recorded details before deciding what action is appropriate.

Txnora helps users examine available information; it does not guarantee that every issue will have a definitive explanation.

# 06 — Users and Invitations

User and invitation management is available to administrators.

## Managing users

The Users section allows administrators to review user records and the information displayed for each account.

Support users do not have access to the administrative Users and Invitations sections.

## Inviting a team member

An administrator can invite an employee by entering their name and email address in the Invitations section.

The Invitations page also displays invitation and account-status information available in the application.

## Accepting an invitation

An invited employee can activate their account by following these steps:

1. Open the invitation link received by email.
2. Enter a new password that meets the displayed requirements.
3. Confirm the password.
4. Submit the form to activate the account.
5. Return to the login page and sign in with the new credentials.

Invitation links expire. If a link has expired or cannot be used, contact your administrator for assistance.

## Account access

If a user cannot access an administrative section, the restriction may be related to their assigned role. Contact your administrator if you believe you have been assigned the wrong access level.

# 07 — Settings and Account Security

The Settings section contains two areas: **Account** and **Security**.

## Account

The Account section displays your registered account information, including:

- Full name.
- Work email address.
- Assigned account role.

Account details are managed by the organization's administrator.

## Security — Change Password

Users can change their password through the Security section.

To change your password:

1. Open Settings and select Security.
2. Select Change password.
3. Enter your current password.
4. Enter your new password.
5. Confirm the new password.
6. Submit the form.

The new password must contain at least eight characters. It must also differ from your current password, and both new-password entries must match.

After a successful password change, Txnora signs out the current browser session and redirects you to the login page. Sign in again using your new password.

If the current password is incorrect or the request cannot be completed, review the message displayed by the application and follow the instructions provided.

## Security best practices

- Keep your password private.
- Choose a password that you do not use for other accounts.
- Do not share your sign-in credentials with colleagues.
- Sign out when you finish using a shared computer.
- Contact your administrator if you experience account-access problems.

# 08 — Frequently Asked Questions

## A transaction has been processing for a long time. Has it failed?

Not necessarily. PROCESSING means the transaction is recorded as in progress. Review its history and available investigation findings. A long delay alone does not establish that the transaction has failed.

## Why is a transaction marked FAILED?

Open its investigation details and review the available findings. A failure reason may be displayed when a recorded risk-evaluation result provides one. If the reason is unavailable, further investigation may be necessary.

## Does AUTHORIZED mean the transaction is settled?

No. Authorization and settlement are different stages. Txnora records settlement completion separately through the SETTLED status.

## Why is a definitive failure reason not available?

The system can display only the information available in its transaction and investigation records. Some cases may require additional review to establish the cause.

## Why can I not see Users or Invitations?

These sections are restricted to administrators. If you use a Support account, this is expected. Contact your administrator if you believe your account role is incorrect.

## What should I do if my invitation link has expired?

Contact the administrator who invited you and request assistance with account activation.

## What happens after I change my password?

Txnora redirects you to the login page after a successful password change. Sign in again with your new password.

## 09 — Recommended Practices

For consistent and reliable use of Txnora:

- Review transaction details before making decisions.
- Distinguish between authorization and completed settlement.
- Investigate failed or unusually delayed transactions when appropriate.
- Base conclusions on recorded information rather than assumptions.
- Follow your organization's procedures when further investigation is required.
- Protect your account credentials and respect access permissions.

## About This Guide

This guide describes the user-facing features and workflows available in Txnora. The information shown for an individual transaction depends on the records and investigation results available for that transaction.

For unresolved issues or account-access concerns, follow your organization's established support procedures.
